

Unheralded standouts enjoy career seasons By Mike Jones

As the NBA's All-Star fan balloting winds down in the next week, the usual suspects Kevin Garnett, LeBron James, Kobe Bryant and Yao Ming lead the way. Tim Duncan, Dwyane Wade, Tracy McGrady and Jason Kidd also rank among the leading vote-getters.

That's definitely the best of the best right there no-brainers when it comes to filling All-Star rosters. But who would make the All-Underrated Team?

When building a team, a scorer counts as one of the key ingredients for success. And who better to fill that role than the league's sixth-leading scorer this season?

After two injury-plagued seasons, New Jersey's Richard Jefferson remains under the radar despite enjoying one of the finest seasons of his career.

Averaging a career- and team-high 24.4 points to go with 4.4 rebounds and 2.8 assists, Jefferson hasn't shown any ill effects from the ankle surgery that ended his 2006-07 season in January, playing all 36 games this year. And he is also versatile another key ingredient to building a team playing either guard or forward.

The most improved yet still often overlooked point guard this season is Toronto's Jose Calderon. The third-year player from Spain averages 8.3 assists, sixth in the league. Even more impressive is his league-best assist to turnover ratio of 6.02.

Anchoring the frontcourt is the Clippers' Chris Kaman, who ranks 10th in All-Star voting among Western Conference centers despite posting a breakout season with teammate Elton Brand sidelined with injury.

The 7-foot, 265-pound fifth-year player out of Central Michigan entered the season averaging 9.3 points, 7.4 rebounds and 1.2 blocks. But he has increased his production to 17.9 points, 13.7 rebounds and 3.00 blocks a game.

Breast implants before surgery: Do you discuss your health in addition to the shape and size of the breast, the doctor before surgery will be the first to confirm that your body is healthy, and to assess the benefits of breast implants surgery and potentially dangerous.

Although breast implants surgery is usually appears safe and reliable scale, but any surgery under anesthesia exist dangerous. Even if there are only a few signs that you may have on the surgery, anesthesia, the adverse effects of the healing process, or surgery may be your vice-health effects, doctors may decide not to give you an operation until the risk factors decreased or disappeared before considering surgery. Infection, poor wound healing, and even certain drugs smoking can be a doctor for your decision not to carry out the reasons for the surgery.

Breast implants in the surgeon performed under local anesthesia. Surgery will be in the lower part of the breast fold, armpit or around the areola do a skin incision. If the incision in the armpit, usually with a surgical endoscope to expand horizons. Endoscopy sometimes in the fold incision under the breast was also used. Through the incision, doctors will be decomposed to a lacunar placed implants, the implants you will be placed on one of the following two parts:

1. Breast implants surgery - placed directly under the breast tissue: At this time of implantation in the top of pectoralis major.

Advantages: no friction breast implants, this can be the most appropriate to maintain the original breast implants shape.

Disadvantages: Although the new implants in the produce less, but may still around in the implantation of a clear, tight scar tissue (called capsular contracture). If your existing breast tissue thin, then touched the surface of the prosthesis will also be emphasized.

2. Breast implants surgery - under the pectoralis major advantages: This method produced the risk of capsular contracture fewer drawbacks: you need a longer recovery period, the wounds have not yet fully healed, you will find it difficult to raise their hands, the doctors will recommend that you limit as much as possible early in the arm movement, this will result in the displacement of the implant or a faster deformity.

How long must surgery, postoperative recovery takes how long?

Surgery generally takes 1-2 hours, and recovery time is usually short-lived. Not after hospitalization, can go home.n

Breast implants surgery should think twice before

Over the past 35 years of about 3 million, made breast implants surgery.

German scientists on the 200 which had long-term observation study, as confirmed by silicon breast is not the filling of the past, as is the alleged long-lasting and safe. They found that breast implants, the surgery was very successful, 1 / 3 of the liver in silicon, their immune system affected, some Yinji more easily attack. In addition, breast implants after surgery about 1 / 3 of the surgery, a few years later, a defective breast implants, it is necessary to re-replacement filler. In this way, there will be more by the President silicon hazards. Therefore, the expert warned: breast implants surgery should think twice before taking any action.
