

Some Aspects of Acupuncture

Clinical Acupuncture Practice Acupuncture needles used for clinical practice are special needles of fine diameter made of stainless steel and are not hollow. The needle has a thick bronze wire wound on its upper third and a handle for firm grip. Each acupuncture style has a unique insertion depth and type of needle used. The acupuncture point is heated with a process called moxibustion. Safety of Acupuncture The acupuncture process is safe to perform if it's done by a certified acupuncturist. Acupuncture therapists are now commonplace and you should be able to talk to him or her about your condition and any specific questions or queries you might have. The equipment is safe and clean. The needles used are pre sterilized and disposable. Thus they are safe to use and unlikely to transmit disease. Complementary Therapy With Acupuncture Acupuncture can be used as a complementary therapy for the following conditions:

Anxiety

Neuralgias

Migraines

Chronic pain

Arthritis

Bruxism

TMJ pain

Allergic rhinitis A trained acupuncturist can also advise on other conditions where acupuncture may be of use and you should be able to discuss your particular case and concerns with him or her. Most, if not all, practitioners will be happy to discuss your requirements with them and they will not wish for you to part with any money until you are satisfied as to the process. Acupuncture is a relatively safe, painless and without any notable side effects. Under an expert acupuncturist you can relieve your pain the Oriental way!

About the Author

Provides aquatic fitness leaders with training based on current.
