

## Medical Record Software

Today, medical records software has become an integral part of medical offices and hospitals. Storing and organizing thousands of medical records is not only time consuming but susceptible to error. However, there are software programs on the market with the propensity to rid hospitals and medical offices of this trouble. The following are some examples of medical records software programs used by medical professionals today. Ergo Partners, an active player in the electronic medical records field, have come up with software called EMRitus. The compound modules that constitute this software were developed with valuable input from doctors and nurses whose job warrants them to be in constant touch with medical records. Consequently, the EMRitus software has several features. They include: recording a patient's employment information, recording a patient's contact information, listing a patient's problems and the status of treatment, easy scanning and transferring paper records into electronic records, et al. EMRitus allows doctors and nurses to stay abreast of the varying conditions of a patient and to give the correct treatment. Charting Plus is another software program broadly used for keeping medical records today. One of the greatest benefits of this software is its compatibility with Tablet PCs. This makes the medical records more portable. Charting Plus has several features. They include: providing proper system for medical treatments, offering the user the facility to generate and print patient instructions, prescriptions, referral letters etc; providing HIPAA-certified security for medical records; offering quick access to key information, like body mass index charts, immunization records, preventative medicine reminders, etc. Charting Plus is a flexible software program that can fit the precise needs of the medical professional as well as the patient.
